Descripción/Description: compact spread of stones within the Southern 2/3rds of the trench. At first thought to be a surface, but then to be within a cut, but finally decided it lay within a slight natural hollow that formed in the scoria gravel spreads below (2082) below. It transpires that 2081 covers more- or less the same area as the 'road' surface 2083. Close to the PUKAO was a 'poro'- a large cobble sized beach smooth basalt stone with smooth faces, but broken off at one end (22x18x12cm) PTO?			
Interpretación/Interpretation: compacted layer of rubble that has collected in the hollow of the road after a sequence of scoria gravel deposits (2082).

Inclinación:		Truncated?:	
Descripción/Description: uppermost layer of 'Road' consisting of an approximately 1cm (or 1.5cm) thick deposit of clay. No laminations visible in its structure suggesting it's not a natural deposit - looks homogenised. The surface appears to be laid within a concavity within the top of layer 2084, but there is no clear evidence that this might represent an intentionally formed concave road. There is no evidence of a kerb or road edge. The surface is best preserved along its northern edge and in the SE corner of the trench. These are the			
Interpretación/Interpretation: Although function as the edge of the third road surface [2094], this deposit probably relates to the second ana pulcao. It is a layer of clay laid down to provide a solid (concrete hard when dry) road surface. Present on both southern & northern 'kerb' areas but clearly worn through in centre (bottom) of road. PTO?

Further comments/description: most sloping bits of the surface in PLAN quite smooth and clayey. This appears to have been worn away to the south where the surface is less compact and sandier and contains more red scoria. To the south this layer also appears to have been worn away to reveal a smooth 'crust' of 'concreted' red scoria in the lowest part of the road concavity. To the south of this the yellow green clay reappears as the slope of the south side of the road rises. Turned concrete hard when dried a few days after first excavated.

Descripción/Description: PATCHES OF RECENTLY ERODED (ROAD?) SURFACE, INTERMINGLED WITH THE RED SCORIA CONCRETE BELOW ROAD 2083. IT WAS NOT DETECTED ON EXCAVATION AND WAS ONLY OBSERVED IN THE EASTERN SECTION OF TRENCH. DIMENSIONS ARE HARD TO ASCERTAIN DUE TO HIGH LEVELS OF EROSION, WHICH MAKE DIFFICULT TO DETERMINE THE EXTENSION BEYOND THE SMALL PATCHES VISIBLE ON PROFILE. HOWEVER, COLOUR AND TEXTURE ARE REMINISCENT TO ROAD SURFACE 2083, ALTHOUGH IT IS MUCH THINNER AND LESS COMPACT.			
Interpretación/Interpretation: IN PRINCIPLE, IT APPEARS THAT AN EARLIER ROAD (WHICH BELONGS TO 2083) WAS BUILT, BEING ERODED BY THE SAME PROCESS WHICH DESTROYED THE RED SCORIA DEPOSIT ON WHICH IT STANDS. PTO?

						Contaminación/ Contamination?	
Color de capa/relleno/LAYER/FILL Colour: red				Inclusiones, con %, tipo, forma, tamaño/ Inclusions with %, type, shape, size: variable. some pebbles & silts.			
Textura/composición/Texture/Composition: small lenses of small screen 'pebbles' dividing finer silts.							
Consistencia/compactación/Consistency/Compaction: firm-loose				Homogeneidad/Sorting:		Contenido agua/ Water content	
Forma de corte/CUT Shape:		Esquinas/Corners:		Matrix con las relaciones estratigráficas inmediatas/Matrix showing immediate stratigraphic relationships			
				2092 2094 2093 2083 2084 Sobre/ Above Este contexto/This context Below/bajo			
Desnivel superior/Break slope top:		Laterales/Sides:					
Desnivel inferior/Break slope base:		Base/Base:					
Inclination:		Truncated?:					
Descripción/Description: Lenses of screen debris							
Interpretación/Interpretation: This material fills the concave hollow of the secondary area - and given the presence of partial road surfacing (2094) above must represent a fill accumulation (and bumping) the second road. This suggests a period of disuse after the second road was open and utilized.
